@endsection
```

The code loops through the values of the passed in store and displays them in a card view. It also accesses the products related to this specific store through a One to Many Eloquent Relationship. This was defined in the models which says that a store has a "hasMany" relationship to the product model. Connecting them is the store_id column in the product model.

We made it so that the individual products can be accessed through this screen by adding an anchor to the product status that connects to the show function in the ProductsController. Each product could also be edited and deleted from this screen.
